Install Notes:

First time:

- Install Python 3.9

- Click to Download; you should click checkbox, add python to path during installation.

- Extract code in a folder and run install_pre.bat which will install libraries for the code.

- list.txt should contain the domains.

- info.json contains the information related to credentials for checking out.

On every run:

- Run fetch_product_listing.bat to fetch products list from the domains (list.txt file). A products.txt file would be created containing the fetched products.

- After you have done these steps, you have to open run.bat to do checkout on the fetched products.

- report.csv contains the progress report for the products checkout listing.
